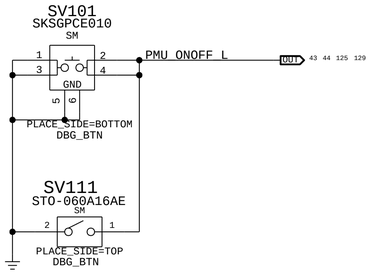
POWER BUTTON

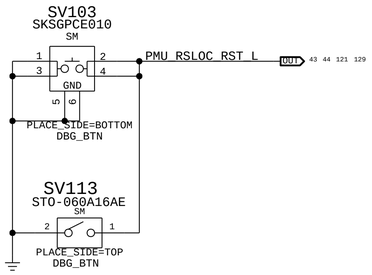
Imitate a user-facing Power Button press, many functions:
- Press to Wake from any state
- Combine with RSLOC (see RSLOC)
- Hold for 8sec to trigger "one-finger reset"
- - Similar to PMU RESET, except SW gets a warning to initiate panic-flow



RSLOC BUTTON

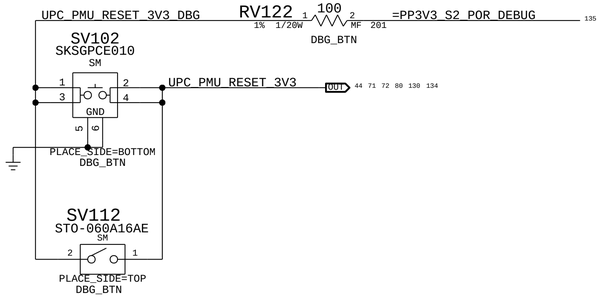
Imitate a user-facing key combo Right-Shift + Left-Option + Control:
- Hold RSLOC 4sec, then press Power Button to initiate PMU RESET
- Hold RSLOC 4sec, then hold Power Button 4sec to power-cycle P3V8AON VR
- Hold Power Button 1sec, then hold RSLOC 10sec to trigger PMU RESET into DFU

(continue holding first button when second button is added)



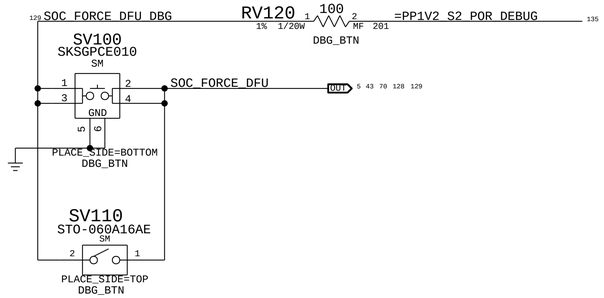
PMU RESET

PMU transitions to OFF and automatically proceeds up to AWAKE



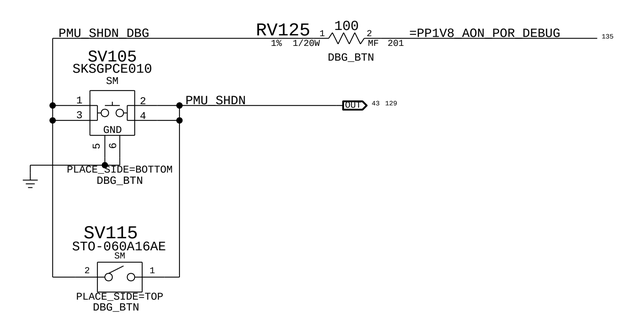
FORCE DFU

Hold during OFF->AWAKE transition to enter SOC's "Debug Firmware Update" mode



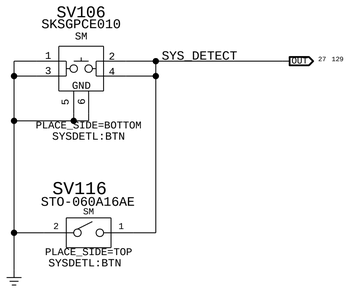
PMU SHUTDOWN

PMU transitions to OFF state and waits for a WAKE source*



SYS_DETECT (Battery Disconnect)

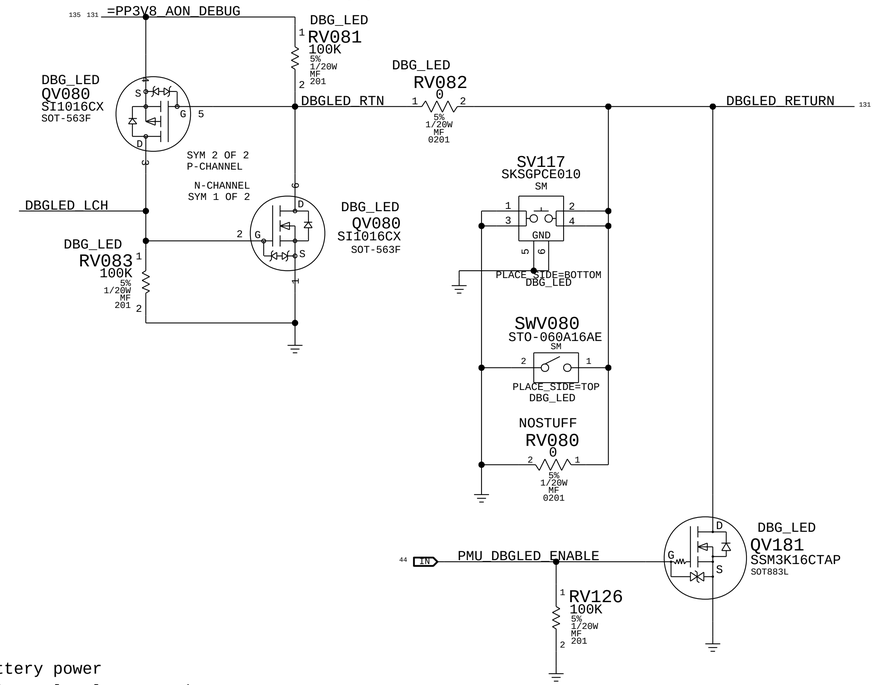
Imitate unplugging the battery signal flex, to disconnect MLB from Battery power
- Disconnect all DCIN sources, then hold SYS_DETECT for 2sec. MLB will completely power down



Debug LED Latch

Press button once to engage.
Remove power to disengage.

Debug LED Enable



*WAKE sources in OFF:
CHGR_AUX_OK (DCIN present)
IPD_LID_OPEN_1V8 (Lid is open)
PMU_ONOFF_L (User Power Button)

Internal signal aliases - Must be configured on project pages per notes below.

SOC, series caps | BBR A side | BBR B side | Connector

Caps and connector must be aliased to BBR signals.
BBR lanes 1 and 2 can be swapped, both pairs, both sides - all or nothing.
BBR inputs can be polarity inverted independently per pair.
All swaps and inversions must be communicated to TBT Firmware team.

Internal signal aliases - Copied or debug circuitry added between.
